

Highway-Rail Grade Crossing Accident Prediction System

Accident Prediction Report for
Public at-Grade Highway-Rail Crossings

Including:

Disclaimer/Variable Key
Accident Prediction Report
Crossing Profile
Accident History

Provided By:

Federal Railroad Administration
Grade Crossing and Trespasser Outreach Division

Data Contained in this Report:

County: ST LOUIS

Date Prepared: 09/06/2024

USING DATA PRODUCED BY GXAPS

(Highway-Rail Grade Crossing Accident Prediction System)

GXAPS generates reports listing public highway-rail intersections by State, County, City, railroad, or crossing ID ranked by predicted accidents per year. These reports include the current highway grade crossing inventory record and the accidents over the last 5 years. These data are produced using the Federal Railroad Administration's New Accident Prediction and Severity Model (APS), 2020.

GXAPS is a statistical model that provides users an analytical tool that can assist in determining where scarce highway-rail grade crossing resources can best be directed. GXAPS does not rank crossings in terms of most to least dangerous. Use of the GXAPS accident prediction formula in this manner is incorrect and misleading. GXAPS output enables State and local highway and law enforcement agencies to identify public highway-rail crossing locations which may require additional or specialized attention. It is also a tool which can be used by state highway authorities and railroads to nominate crossings which may require physical safety improvements or enhancements.

The GXAPS accident prediction formula is based upon two independent factors (variables) which includes: (1) basic data about a crossing's physical and operating characteristics, and (2) the last full five years of accident history data available at the crossing. These data are obtained from the FRA's inventory and accident/incident files which are subject to keypunch and submission errors. Although every attempt is made to find and correct errors, there is still a possibility that some errors exist. Erroneous, inaccurate, and non-current data will alter GXAPS accident prediction values. While approximately 100,000 inventory file changes and updates are voluntarily provided annually by States and railroads and processed by FRA into the National Inventory File, data records for specific crossings may not be completely current. Only the intended users (States and railroads) are knowledgeable as to how current the inventory data is for a particular State, railroad, or location.

It is important to understand the type of information produced by GXAPS and the limitations on the application of the output data. GXAPS does not state that specific crossings are the most dangerous. Rather, GXAPS data provides an indication that conditions are such that one crossing may possibly be more hazardous than another based on the specific data that is in the program. It is only one of many tools which can be used to assist individual States, railroads, and local highway authorities in determining where and how to initially focus attention for improving safety at public highway-rail intersections.

GXAPS is designed to nominate crossings for further evaluation based only upon the physical and operating characteristics of specific crossings as voluntarily reported and updated by States and railroads and five years of accident history data. GXAPS is not designed to single out specific crossings without considering the many other factors which may influence accident rates or probabilities. State highway planners may or may not use GXAPS. Some States utilize their own formula or model which may include other geographic and site-specific factors. At best, GXAPS nominates crossings for further on-the-ground review by knowledgeable highway traffic engineers and specialists. The output information is not the end or final product, and the GXAPS data should not be used for non-intended purposes.

It should also be noted that there are certain characteristics or factors which are not, nor can be, included in the GXAPS database. These include sight-distance, highway congestion, bus or hazardous material traffic, local topography, and passenger exposure (train or vehicle), etc. Be aware that GXAPS is only one model and that other accident prediction models which may be used by States may yield different, but just as valid results for ranking crossings for safety improvements.

Finally, it should be noted that this database is not the sole indicator of the condition of a specific public highway-rail intersection. The GXAPS output must be considered as a supplement to the information needed to undertake specific actions aimed at enhancing highway-rail crossing safety at locations across the U.S. The authority and jurisdiction to appropriate resources toward the safety improvement or elimination of specific crossings lies with the individual States.

VARIABLE KEY

for use with GXAPS Reports

The lists produced are only for public at-grade highway-rail intersections for the entity listed at the top of the page. The parameters shown are those used in the accident prediction calculation.

PRED ACC RANK:	Crossings are listed in order and ranked with the highest accident prediction value first.
AVG PRED ACC:	The accident prediction value is the probability that an accident between a train and a highway vehicle will occur at the crossing in a year.
HIST AVG PRED ACC:	The historical accident prediction value is the probability that an accident between a train and a highway vehicle will occur at the crossing in a year.
GX ID:	The unique site specific DOT/AAR Crossing Inventory Number.
RR CODE:	The unique alphabetic FRA railroad code for the specific railroad.
CITY, STATE (COUNTY):	The city, state, and county which the crossing is located.
STREET:	The name of the road, street, or highway (if provided) where the crossing is located.
YEARLY ACCIDENT COUNT:	The Annual report includes only complete calendar year data. Annual complete calendar year data is released on March 1 each year. The Cyclic Report provides accident data for the past 60 months by the current cycle. That is, if the most recent month of available data is December 2023, then the Current Cycle is 12/31/2023-11/30/2022, the next most current cycle is 12/31/2022-11/30/2021, for a full five cycles. Note that the cyclic report provides partial year information as the data is released each month.
DATE CHG:	The date of the latest change of the warning device category at the crossing which impacts the accident prediction calculation, e.g., a change from crossbucks to flashing lights, or flashing lights to gates. The accident prediction calculation utilizes three different formulas, on each for (1) passive devices, (2) flashing lights only, and (3) flashing lights with gates. When a date is shown, the accident history prior to the indicated year - month is not included in calculating the accident prediction value.
W D:	The type of warning device shown on the current Inventory record for the crossing where: FQ = Four Quad Gates; GT = All Other Gates; FL = Flashing lights; HS = Wigwags, Highway Signals, Bells, or Other Activated; SP = Special Protection (e.g., a flagman); SS = Stop Signs; XB = Crossbucks; OS = Other Signs or Signals; NO = No Signs or Signals.
TOT TRN:	Total number of trains per day at the crossing.
TOT TRK:	Total number of railroad tracks between the warning devices at the crossing.
TTBL SPD:	The maximum (allowable) timetable speed for trains through the crossing.
HWY PVD:	Is the highway paved on both sides of the crossing?
HWY LNS:	The number of highway traffic lanes crossing the tracks at the crossing.
AADT:	The average daily traffic count of highway vehicles at the crossing.

U.S. Department
of Transportation
Federal Railroad
Administration

RANKED PUBLIC HIGHWAY-RAIL CROSSINGS FIVE YEAR TOTAL ACCIDENT HISTORY

Yearly accident count includes only complete calendar year data. If interested in partial year data, run the cyclic report option.
